Eligible to work in Canada

NIPUNIKA JAIN

AI Product Manager | Agentic AI | Enterprise SaaS

nipunikajain@gmail.com • (672) 337-1031 • Vancouver, BC • LinkedIn • GitHub • Blog

AI Product Manager with 10+ years across software engineering, data science, and enterprise product delivery. Own AI guardrails and agent initiatives at Infoblox, improving guardrail block accuracy from 74% to approximately 94% and leading GA readiness across 30+ epics. Hands-on in discovery, prioritization, requirements, engineering collaboration, and acceptance testing. Previously launched a self-serve AI product generating €200K ARR. MBA, UBC Sauder

PROFESSIONAL EXPERIENCE

Senior AI Product Manager | Infoblox IQ (AI Assistant & Agent Platform)

Vancouver, Canada | May'26 – Present

AI assistants and agents for enterprise network infrastructure and cybersecurity

- Improved AI guardrail block accuracy from 74% to approximately 94% by designing a two-pass, context-aware LLM classifier and driving it from proof of concept to production enforcement with engineering, data, and security teams
- Drove an MCP agent endpoint to embed Infoblox IQ in customer agent stacks; defined tool contracts, execution flows, per-user OAuth, and human-approved writes, and validated Kubernetes deployment through a Slack to IQ to ServiceNow SOC proof of concept.
- Reviewed MCP authorization behavior against engineering implementation; identified a defect that allowed access when authorization checks failed and a subsequent regression that blocked legitimate access
- Analyzed production customer conversations in Databricks to classify needs and measure first-response resolution; tested 41 agent conversation threads and filed 13 triaged defects.
- Defined user flows and acceptance criteria for agentic operations, including approval-gated changes and verification under role-based access controls. Partnered with QA on test plans and validated feature behavior against requirements; gathered SME input to guide remediation workflows.
- Led GA readiness across 30+ epics spanning agents, actions, guardrails, and observability; aligned engineering, data, UX, and security, and prepared FAQs, and product documentation
- Built the first customer-level AI COGS model across cloud and on-premises deployments; found that QA traffic accounted for 97% of measured inference cost and identified attribution gaps to inform pricing, packaging, and margins

Product Manager, MBA Internship | Sage- Intelligent Time

Vancouver, Canada | May–Jul 2025

Enterprise time-tracking software for professional services firms (lawyers, accountants) who bill in 6-minute increment

- Spearheaded the Sprint 0 kickoff for Leave Management within Sage Intelligent Time SaaS platform by authoring the business case, researching accrual logic, validating flows with design, defining the API contracts for five services, setting non functional requirements, and handing off a groomed backlog
- Led discovery and experimentation for an agentic AI alternative to legacy time entry, building a working prototype, validating through customer feedback, and modeling unit economics that demonstrated 3x ROI and 60% reduction in billing errors, translating the recommendation into a clear business case for executive investment
- Identified an opportunity to cut competitive research from 10 days to 2 days and save 15 to 20 hours per week of analyst time by conducting discovery interviews, mapping the existing workflow, scoping requirements, and iterating from low fidelity prototype to working demo in Lovable
- Defined the 3-year AI-integrated product roadmap by synthesizing customer feedback, competitive benchmarking across 21 tools, and usage analytics to identify AI-driven expansion opportunities, aligning executive stakeholders on investment priorities and go-to-market positioning for new capabilities

Senior Consultant – Product & AI |Deloitte

Pune, India | 2022–2024

Client-facing consulting embedded with enterprise teams across fintech (PayPal), banking, and pharma

- Delivered an enterprise Retrieval Augmented Generation (RAG) from concept to scaled deployment for banking and pharma clients in four weeks by translating compliance, cost, and timeline constraints into requirements, evaluating three build approaches, selecting the target architecture, leading a three engineer team to execution
- Reduced unclassified complaint rate from 11% to 5% in a regulated pipeline by defining hallucination and consistency thresholds with engineering and compliance, building prompt regression checks against a labeled evaluation set, and prioritizing three use cases by regulatory risk
- Reduced API response times by 30x and unblocked a 25-person operations team by scoping and driving a gRPC platform migration across 8 APIs, defining service-level requirements, aligning cross-functional stakeholders on shared dependencies and trade-offs, and delivering in two months with zero downstream breakage
- Defined requirements and drove delivery of end-to-end MLOps infrastructure including training and inference pipelines, drift detection, and CI/CD for model deployment, establishing KPIs for model reliability and performance to ensure production AI systems maintained quality at scale
- Built AI literacy across the product organization by mentoring six analysts on LLM architecture tradeoffs, model evaluation best practices, and delivery prioritization, implementing sprint rituals and quality gates that improved team confidence in navigating complex AI initiatives

Product Manager & Senior Data Scientist |Aioneers Technologies (startup)

Pune, India| 2021–2022

Supply chain SaaS company helping manufacturers and retailers with demand forecasting and inventory optimization

- Shipped a self-serve AI forecasting product from zero to one, generating €200K ARR by leading discovery with four domain analysts,

Eligible to work in Canada

scoping the ML-powered MVP, onboarding the first client, and tracking activation and adoption metrics to cut time-to-value from six weeks to five days

- Improved forecasting accuracy from 22% to 70% across 1000 product time-series by training LightGBM models and implementing Kaggle winning approach, reducing client safety stock by 20%
- Reclaimed 20 % engineering capacity across three teams by taking ownership of an internal shared library, defining an ownership model and contribution guidelines, prioritizing the backlog, and leading two developers through execution, reducing PR approvals from two weeks to under two days

Technical Engineer – Data Science | Ecolab Food, Safety, & Hygiene Solutions **Pune, India | 2019–2021**

Fortune 500 global leader delivering sustainability and operational excellence solutions across critical industries

- Built an end to end data platform from SAP HANA to Azure using Azure Data Factory, Databricks, and CI/CD, designed client facing Power BI dashboards with KPI frameworks, cutting processing time 60% and enabling 100 plus daily supply chain reports
- Saved $110K annually by building warehouse optimization and ranking recommendation models using heuristic and OR based approaches, replacing manual space allocation and resource planning decisions

Application Development Analyst | Accenture India Pvt. Ltd. **Mumbai, India | 2014–2019**

Technology consulting and services; worked across data science & analytics for enterprise clients

- Standardized the production path by shipping a Python project scaffold with CI and CD and environment variable based configuration, driving 80% adoption across five data science teams
- Boosted client sales 22% and vendor model accuracy 25% with 15% cost reduction by designing predictive analytics models for retail clients

PROJECTS

AI Competitive Intelligence Platform | Python, FastAPI, LangGraph, React — Demo, GitHub

Built an agentic AI platform using LangGraph, Claude API, and React that autonomously discovers competitors, generates market landscapes, and produces feature comparisons and pricing analysis — demonstrating how generative AI and agentic workflows can replace static processes with scalable, AI-driven intelligence for product and GTM teams

BY-API MCP Harness | Python, Model Context Protocol | In progress, Github

Developing a reusable framework to help teams expose existing APIs as tools for AI agents. Planned architecture combines AI-assisted generation of tool manifests and API handlers with an MCP harness for loading and exposing integrations, reducing repetitive integration work. Built an initial server and client prototype demonstrating tool discovery and invocation; expanding toward real API connectivity, authentication, validation, and error handling

EDUCATION

Master of Business Administration, University of British Columbia – Sauder School of Business **May' 2026**

Asia's Top Talent Scholarship, President, Product & Service Management Club

Bachelor of Technology in Electronics & Telecommunications, NMIMS, Mumbai **Aug' 2014**

Founder, Right on Track, student led nonprofit

CERTIFICATIONS & COURSES

AWS Certified Machine Learning Specialist • Technical Product Management (PMI) • LLMs Mastery, Udemy • Complete MLOps Bootcamp, Udemy • A2A: Agent2Agent Protocol, DeepLearning.AI • AI Agents Evaluation, Maven

TECHNICAL EXPERTISE

- **AI & Orchestration:** LLMs (Claude, OpenAI, Gemini), Agentic Workflows, RAG Pipelines, LangChain/LangGraph, Prompt Engineering, Model Evaluation, HITL Frameworks, Cursor, Claude Code, Google AI Studio, GitHub Copilot
- **Product & Delivery:** Road mapping, PRDs, OKR-based Planning, A/B Testing, Wireframing (Figma), Stakeholder Alignment, JIRA, Confluence, Notion, release notes, onboarding documentation, internal comms, activation/adoption metric, Cross-functional collaboration, Go-to-Market for AI Features, KPI Definition
- **Platforms & DevEx:** gRPC Microservices, REST APIs & SDKs, Internal Developer Platforms, CI/CD, FastAPI, Docker, Kubernetes, Workflow Automation, Python, SQL, React, Spark, PowerBI
- **Data & Cloud:** Azure (Databricks, Data Factory, ADLS), AWS (SageMaker, Lambda, Bedrock), Vector DBs (Pinecone)
- **Data Science & ML:** Time Series Forecasting, NLP (DistilBERT, Longformer), Ensemble Learning (LightGBM, XGBoost), PyTorch, MLflow, Scikit-learn, Data Drift Detection, Model Evaluation, Hyperparameter Tuning, MLOps (Training/Inference Pipelines, Drift Detection, CI/CD for Models), NIST AI RMF, AI Governance
